

# **Technical Data**

# Letheen Broth w/Triton X-100

M1459

This medium is recommended for screening cosmetic products for microbial contamination.

## Composition\*\*

| Ingredients                    | Gms / Litre |
|--------------------------------|-------------|
| Peptic digest of animal tissue | 10.000      |
| Beef extract                   | 5.000       |
| Sodium chloride                | 5.000       |
| Lecithin                       | 0.700       |
| Polysorbate 80                 | 5.000       |
| Triton X-100                   | 1.000       |
| Final pH ( at 25°C)            | 7.0±0.2     |

<sup>\*\*</sup>Formula adjusted, standardized to suit performance parameters

#### **Directions**

Suspend 26.7 grams in 1000 ml distilled water. Heat to boiling to dissolve the medium completely. Sterilize by autoclaving at 15 lbs pressure (121°C) for 15 minutes. Mix well and dispense as desired.

# **Principle And Interpretation**

In the early 40s, Weber and Black recommended the use of lecithin and polysorbates to neutralize the antimicrobial action of the quaternary ammonium compounds (4). In 1965, the methodology was accepted by AOAC for the antimicrobial assays and extended their use to all the cationic detergents. In 1978, the FDA incorporated it as pre-enrichment medium for every microbial examination of cosmetics.

There are great chances of altering the chemical composition of cosmetics by the metabolism of organisms thereby spoiling and causing harm to the users (1, 2, 3). Direct colony counts and enrichment culturing are the methods of choice for isolating microorganisms from cosmetic products. The word Letheen represents a combination of lecithin and polysorbate (tween) 80.

Letheen Broth with Triton X-100 is recommended for luxuriant growth of most organisms for detection of yeast and moulds. Triton X-100 is non-ionic and disperses microorganisms making counting easier.

Peptic digest of animal tissue, beef extract provide nitrogenous nutrients, carbon compounds and trace elements to the microorganisms. Incorporation of lecithin and polysorbate 80 to the medium enables the recovery of bacteria from materials containing residues of disinfectant compounds or preservatives used in cosmetics. Polysorbate 80 is added to nullify phenolic compounds, hexachlorophene, formalin and along with lecithin neutralizes ethyl alcohol (5). Lecithin also neutralizes quaternary ammonium compounds present in the cosmetics. Sodium chloride maintains the osmotic balance of the medium. Triton X-100 acts as a surfactant. Cosmetics contain preservatives and they should be at least partially inactivated during the plating and this medium helps in dilution as well as neutralizing.

#### **Quality Control**

### **Appearance**

Cream to yellow homogeneous free flowing powder

#### Colour and Clarity of prepared medium

Yellow coloured, clear solution in tubes

#### Reaction

Reaction of 2.67% w/v aqueous solution at 25°C. pH: 7.0±0.2

## pН

6.80-7.20

#### **Cultural Response**

M1459: Cultural characteristics observed after an incubation at 35-37°C for 18-48 hours.

HiMedia Laboratories Technical Data

| Organism                            | Inoculum<br>(CFU) | Growth         |
|-------------------------------------|-------------------|----------------|
| Escherichia coli ATCC<br>25922      | 50-100            | luxuriant      |
| Staphylococcus aureus<br>ATCC 6538  | 50-100            | luxuriant      |
| Staphylococcus aureus<br>ATCC 25923 | 50-100            | good-luxuriant |

## **Storage and Shelf Life**

Store below 30°C in tightly closed container and the prepared medium at 2 - 8°C. Use before expiry date on the label.
